

Name : SoE Mollo Orange

Date of registration:
21/09/2016

Country : Indonesia

Source: DGIP, Google

Main characteristics/features

SoE Mollo oranges, when ripe, have orange skin, with a bun-like appearance near the stem, and full pulp. They tend to be cylindrical and are easy to peel. SoE Mollo oranges have a uniquely fresh taste, a mixture of sweet and sour without being bitter, and a subtle aroma. Laboratory analysis shows sugar content 15.2-17.6 °Bx (6.57-7.36 %), fibre content 1.86-2.12 %, acid content 1.07-1.20 % and vitamin C content 68.58-78.37 mg/100g.

Geographical area

SoE Mollo oranges are produced in 24 villages in the subdistricts of North Mollo, Central Mollo, Tobu and Fatumnasi, at altitudes of 850-1 200 masl. All are located on the slopes of Mount Mutis, the highest mountain on the island of Timor at 2 400 masl.

Production and processing

SoE Mollo orange saplings are planted in 40x40x40 cm holes at a density of 400 plants per hectare. Seeds are transferred to planting holes, along with organic and non-organic fertilisers, during the rainy season, in December and January. The saplings are cared for by trimming, controlling weeds and diseases and fertilising with manure or appropriate dosages of non-organic fertilisers such as Urea, SP-36 or potassium chloride (KCl). SoE Mollo orange trees blossom from September to December and can be harvested from May to September, so the fruit is ripe around 8-9 months after flowering.

Link between product and territory

The unique characteristics of SoE Mollo oranges are due to the conditions and soil of the areas where they are produced on the slopes of Mount Mutis, as well as the historical, social and cultural factors of the local communities that cultivate them. SoE Mollo oranges are grown in lime-rich gleysol soil types with a pH of 7.33-8.13.
