Main characteristics/features

Rejang Lebong Bengkulu Robusta coffee (Kopi Robusta Rejang Lebong Bengkulu) is classified as fine robusta, which has a dominant chocolatey and spicy flavour with a final score between 81.75-83.33. These values are included in the excellent category.

Geographical area

This coffee is produced from robusta coffee grown at an altitude between 900-1200 masl in the districts of Selupu Rejang, Sindang Dataran and Sindang Kelingi.

Production/processing

Ripe and healthy coffee cherries are manually picked and carefully selected and sorted with a minimum 95 % red cherries. The coffee is processed using the wet or dry methods. To prevent the red cherries that are waiting to be dried from rotting or fermenting they must be stored loosely and not packed into sacks, as this can affect the taste of the coffee products. Coffee beans are dried naturally in the sun on cement drying floors or tarpaulin mats until the water content reaches 12 %. Dried coffee beans are sorted and stored in new sacks in a clean room, free from water, strong odours or vermin.

Link between product and territory

The production area is generally hilly, so it is very suitable for robusta coffee cultivation. The average rainfall in this region is between 1 303-3 137 mm/yr, with a cool climate accompanied by temperatures between 20-25 °C and an average relative humidity of 85.5 %. Soil types in Rejang Lebong regency generally consist of: andosol, regosol, podsolic, latasol and alluvial with the following soil textures: medium, clay and slightly sandy with a soil pH between 4.5-7.5. Climate is one of the main factors in the growth and development of coffee bushes, which includes rainfall, exposure time, temperature, humidity and wind. The wet and dry months in the area are other factors that affect the quality and distinctive taste of this coffee, which is well known by coffee consumers.
